1. Executive Summary

This project is a company portfolio website developed for Yakunex Technologies (Pvt) Ltd. Its purpose is to introduce the company, communicate its services and capabilities, present project examples, share technology-related articles, and allow visitors to submit enquiries. The project uses a React frontend, a Laravel backend API, and a MySQL database. It also includes an administrator area for managing submitted enquiries.

1. Project Objectives

- Create a professional online presence for Yakunex Technologies.
- Present the company's identity, services, capabilities, and project examples.
- Make information easy to find through clear navigation.
- Allow visitors to submit contact enquiries.
- Provide an administrator interface to review and manage enquiries.
- Build a responsive website for desktop, tablet, and mobile screens.

2. Target Users

- Clients and businesses looking for software development or other IT solutions.
- Companies interested in outsourcing or technology support.
- Students, internship applicants, and job seekers interested in the company.

3. Scope and Main Features

3.1. Public Website

- Home page introduces the company and links to important sections.
- Welcome animation provides a branded introduction before transitioning to the main page.
- Projects page presents project examples, descriptions, and technologies. Clearly label conceptual or demonstration work.
- Articles page presents technology-related articles and information.

- Contact page allows visitors to submit contact details and messages.
- Shared navigation and footer help visitors move around the website.

3.2. Administrator Area

- Home page introduces the company and links to important sections.
- Welcome animation provides a branded introduction before transitioning to the main page.
- Projects page presents project examples, descriptions, and technologies. Clearly label conceptual or demonstration work.
- Articles page presents technology-related articles and information.
- Contact page allows visitors to submit contact details and messages.
- Shared navigation and footer help visitors move around the website.

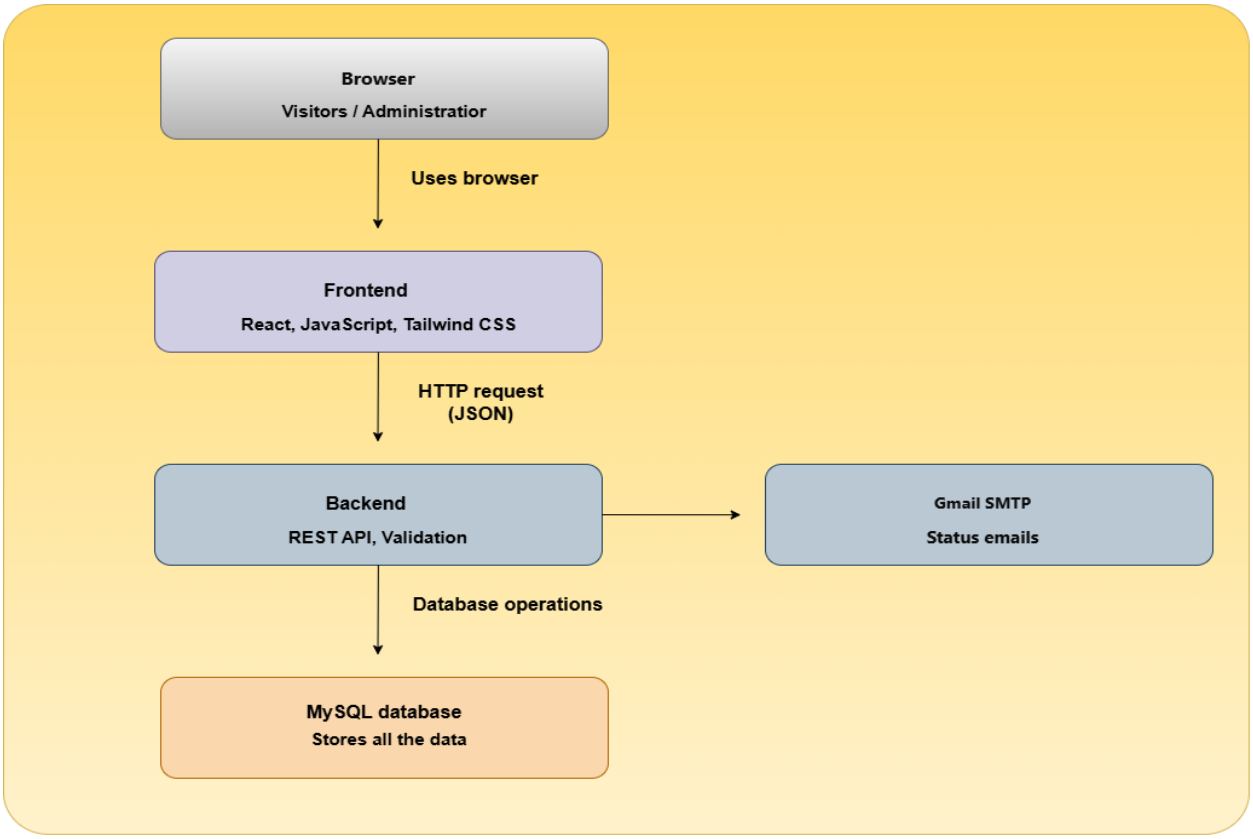

4. Technology Stack

Technology	Purpose	Reason for use
React	Frontend user interface	Reusable components and interactive page content.
JavaScript	Frontend behavior and API communication	Handles interactions, form data, and backend requests.
Vite	Frontend development and build tooling	Provides a development server and production build process.
Tailwind CSS	Styling and responsive layouts	Supports consistent styling and responsive utility classes.

Laravel	Backend and REST API	Handles routes, validation, data operations, and administrator access.
MySQL	Relational database	Stores enquiry records and related information.
Laravel Sanctum	API authentication	Supports token-based authentication for protected administrator requests.

5. System Architecture

The application follows a frontend–backend–database structure. The React frontend sends HTTP requests to the Laravel API. Laravel validates requests and performs database operations. MySQL stores enquiry information.

6. Main Workflows

6.1. Contact Enquiry Workflow

1. A visitor enters contact details and a message in the contact form.
2. The frontend sends the submitted information to the Laravel API.
3. Laravel validates the incoming data.
4. Valid enquiry information is stored in the MySQL database.
5. The backend returns a response and the frontend displays suitable feedback.

6.2. Administrator Workflow

6. The administrator submits login credentials.
7. Laravel verifies the credentials and administrator permissions.
8. After successful login, the frontend uses the authentication token for protected requests.
9. The administrator can view enquiries and update their status or delete them.
10. The backend checks authentication and administrator authorization before protected operations.

7. Design and User Experience

The website aims to provide a consistent and professional presentation of the company. Navigation is shared across the main pages, and content is organized into clear sections. Tailwind CSS responsive utilities are used to adapt layouts to different screen sizes. The welcome animation provides a branded introduction and then transitions automatically to the main page. Record only the responsive and usability checks that have actually been performed.

8. Testing and Quality Checks

Testing was carried out to check the functionality, usability, responsiveness, and reliability of the Yakunex Technologies company portfolio website. The main areas considered were public pages, navigation, contact form, administrator features, API protection, and responsive layouts.

9.1 Test Cases and Results

Test ID	Feature	Test Procedure	Expected Result	Actual Result / Status
T01	Home Page	Open the website in the browser.	The home page and welcome animation display correctly.	Update after checking: Pass / Fail
T02	Navigation	Click Home, Projects, Articles, Contact, and the logo.	Each link opens the correct page. The logo returns to Home.	Update after checking: Pass / Fail
T03	Projects Page	Open the Projects page and review the project details.	Project information, images, and technology details display correctly.	Update after checking: Pass / Fail
T04	Articles Page	Open the Articles page.	Article content and layout display correctly.	Update after checking: Pass / Fail
T05	Contact Form Validation	Submit the form with required fields empty or enter invalid data.	Validation messages appear, and invalid data is not accepted.	Update after checking: Pass / Fail
T06	Contact Form Submission	Enter valid contact information and submit the form.	The enquiry is submitted successfully and stored in the database.	Update after checking: Pass / Fail
T07	Administrator Login	Enter valid administrator credentials.	The administrator can log in and access the dashboard.	Update after checking: Pass / Fail

T08	Invalid Login	Enter incorrect administrator credentials.	Login is rejected, and an appropriate error message is displayed.	Update after checking: Pass / Fail
T09	Enquiry Management	View enquiries and change an enquiry's status.	The administrator can view enquiries and update their status.	Update after checking: Pass / Fail
T10	Delete Enquiry	Delete a test enquiry through the dashboard.	The selected enquiry is deleted as expected.	Update after checking: Pass / Fail
T11	Protected API Access	Attempt to access an administrator API endpoint without a valid authentication token.	The request is rejected, and protected information is not returned.	Update after checking: Pass / Fail
T12	Responsive Design	Resize the browser and inspect the website at desktop, tablet, and mobile screen widths.	Content adapts to the screen size without unwanted horizontal scrolling or overlapping elements.	Update after checking: Pass / Fail
T13	Email Notification	Change an enquiry's status and check the recipient's email inbox.	The configured notification email is received with the correct status information.	Pass only for the status and scenario actually checked

9.2. Responsive Design Testing Procedure

Responsive design was checked using the browser's responsive testing tools and by resizing the browser window to represent different device sizes.

9.3. Steps followed

Opened the website in Google Chrome.

1. Opened Chrome Developer Tools by pressing F12.
2. Enabled the Toggle device toolbar option using the device icon, or pressed Ctrl + Shift + M.
3. Checked the website using mobile and tablet presets and adjusted the viewport width to inspect different screen sizes.
4. Resized the browser window to inspect the desktop layout.
5. Checked the Home, Projects, Articles, and Contact pages at different widths.
6. Inspected the navigation menu, text, images, buttons, cards, forms, and footer.
7. Checked whether content overlapped, became difficult to read, or extended beyond the screen horizontally.
8. Adjusted the layout where necessary and repeated the checks.

****Responsive Design Results**

The responsive layout was reviewed at desktop, tablet, and mobile viewport sizes. The layout was adjusted where necessary to improve the presentation of content on smaller screens.

10. Security Considerations

- Validate submitted enquiry data on the backend.
- Require authentication for administrator-only API operations.
- Check administrator authorization before sensitive actions.
- Keep environment variables and credentials out of the source repository.
- Use appropriate production configuration before public deployment.

11. Limitations and Improvements

Record any issues identified during testing, the improvements made, and the results of retesting.

Issue Identified	Improvement Made	Retest Result
Record any issue encountered during testing.	Describe the change made to address the issue.	Pass / Fail / Not retested

If no additional issues were identified, state: No additional issues were recorded during the tests performed.

13. Repository and Supporting Documents

The source code and supporting project documentation are organized as follows:

- GitHub Repository: https://github.com/zainabmr46-code/yakunex-technologies_portfolio/
- README.md: Project overview, prerequisites, installation, and instructions for running the application.
- docs/wireframe/requirements.md: Project requirements and planned features.
- docs/wireframe/architecture.md: System architecture and technical structure.
- docs/wireframe/testing.md: Testing procedures, results, and known issues.
- Project Report: Project objectives, target users, design decisions, technical implementation, testing, limitations, and future improvements.
- AI and External Resources Disclosure: Details of AI assistance, libraries, and external resources used, as applicable.

The application can be demonstrated locally using the setup instructions provided in the README.md file.

14. Conclusion

The website was reviewed for its main public-facing features, administrator functionality, API protection, responsive layout, and email notification workflow.

The email notification was successfully received for the tested enquiry status change. Final test statuses should reflect the actual results observed, and any remaining issues or untested scenarios should be documented before submission.
